

Alfa Romeo Wireless CarPlay Kit Installation

A: Main unit
B: Video feed cable

D: main harness
E: backup camera harness, we will not use in this case

C: Wireless Anentana

F: Microphone
G: USB cable

Will need couple hand tools:
a small hook with handle
a magnate pan to help fishing cable through
T20 and T30 Torx bit drive for screw removal
and a plastic trim removal tool

Before you start, find out the size of your factory screen, and set switches accordingly.

Everything we need to remove will be under driver side of the dashboard.

Unclip trim cover from the side

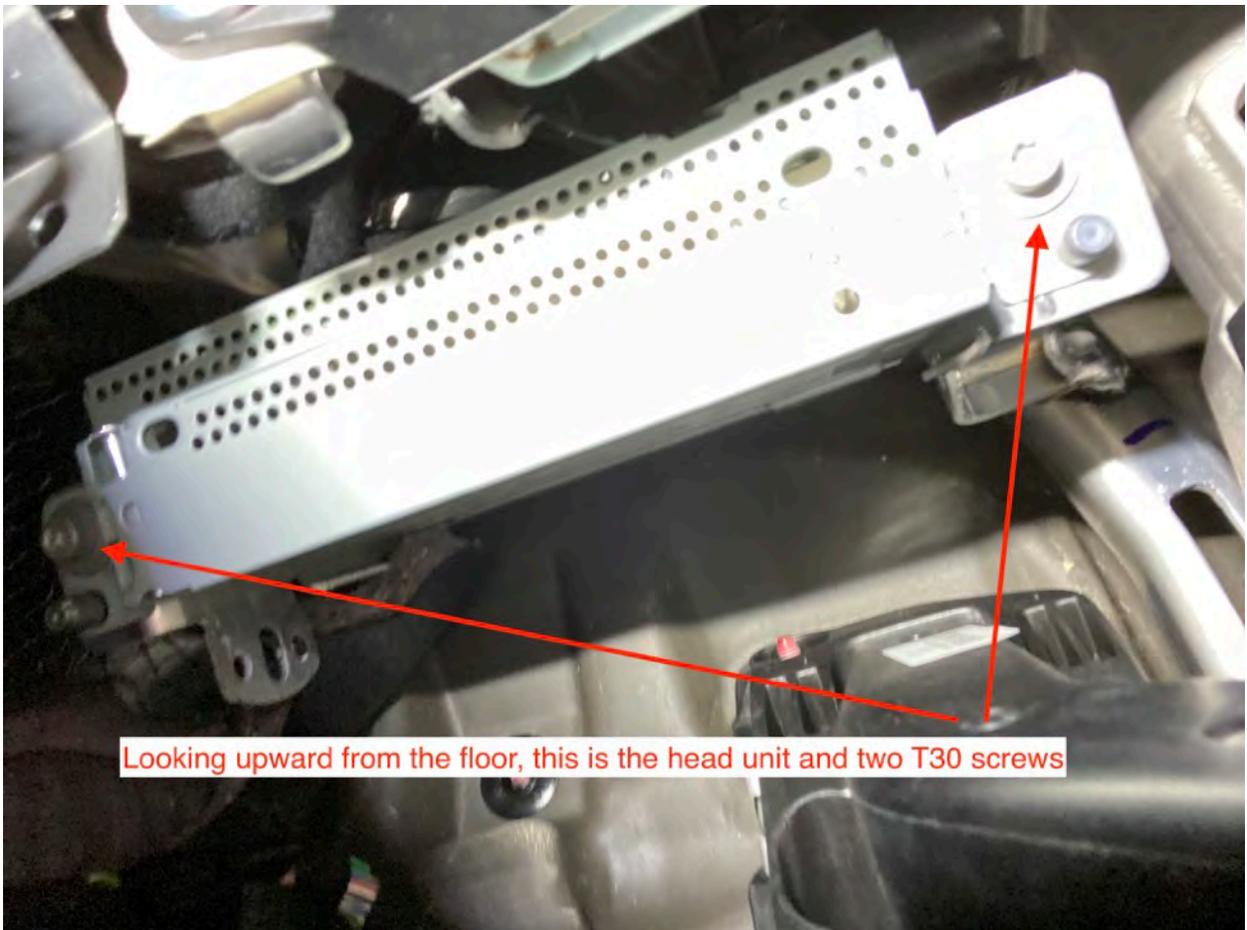

four clips

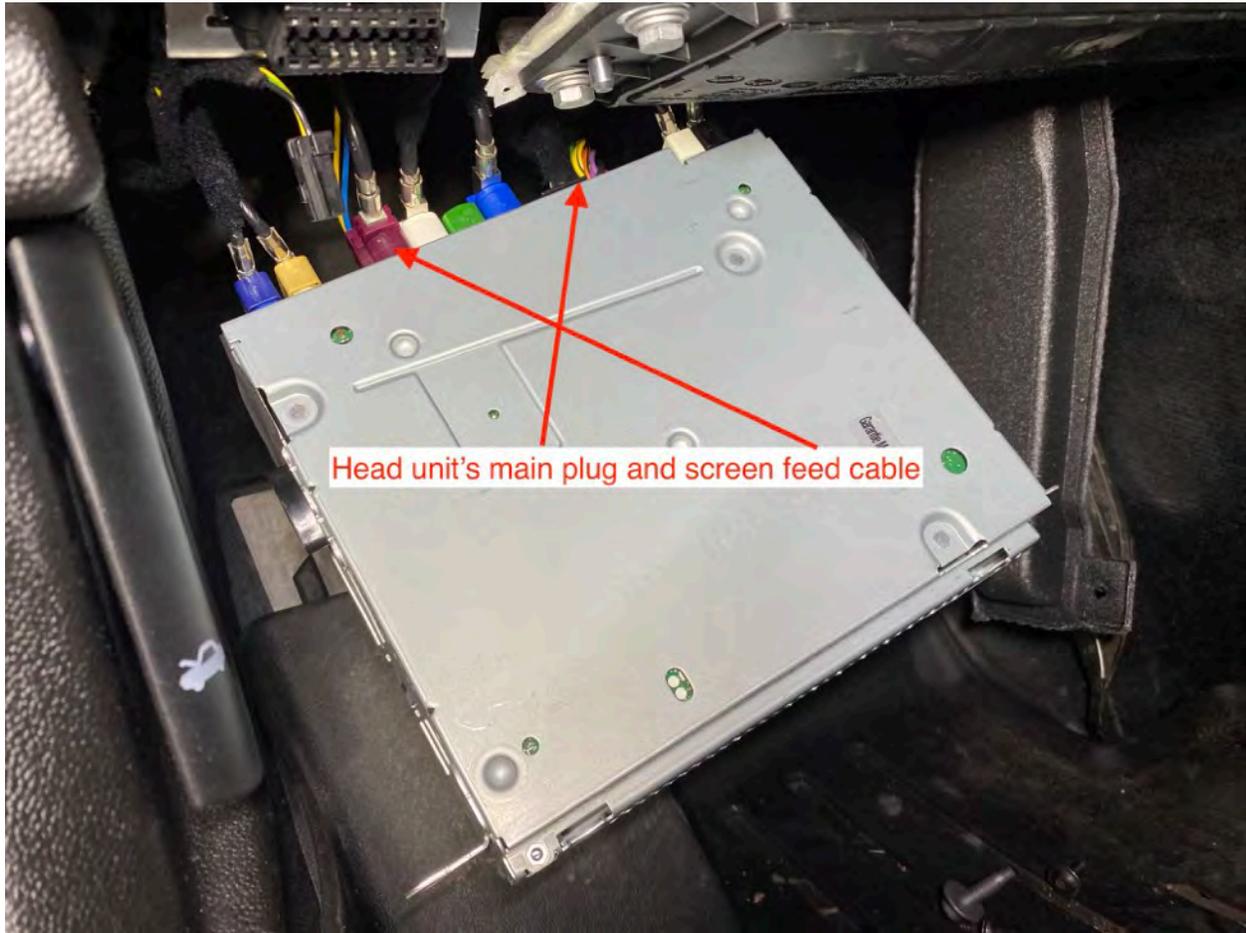

Unclip all those from bottom of the dash, mind the light connectors

Unclip the plastic rivet

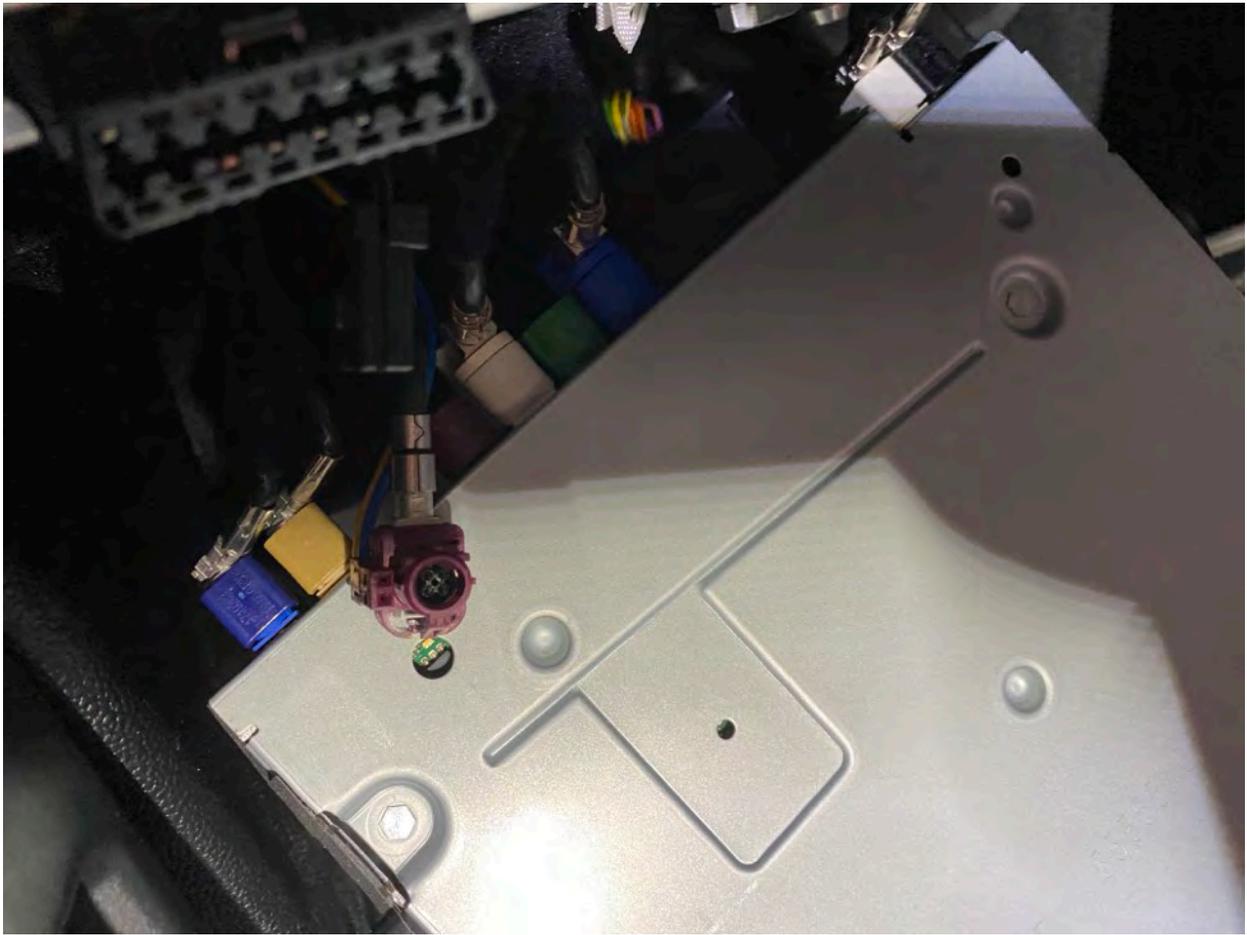

Head unit's main plug and screen feed cable

there is a clip back of the connector
please refer to the both connector from hardness D

fish the cable through, this may take a bit patient

This step we are placing the microphone for carplay voice command to work. there are two ways to place it, first one will be bit difficult but permanent First need to unclip the cover behind the rear view mirror, place the mic behind the slot opening

Fish the mic cable through this route and hide behind the liner

Continue running the cable down and go back to unit

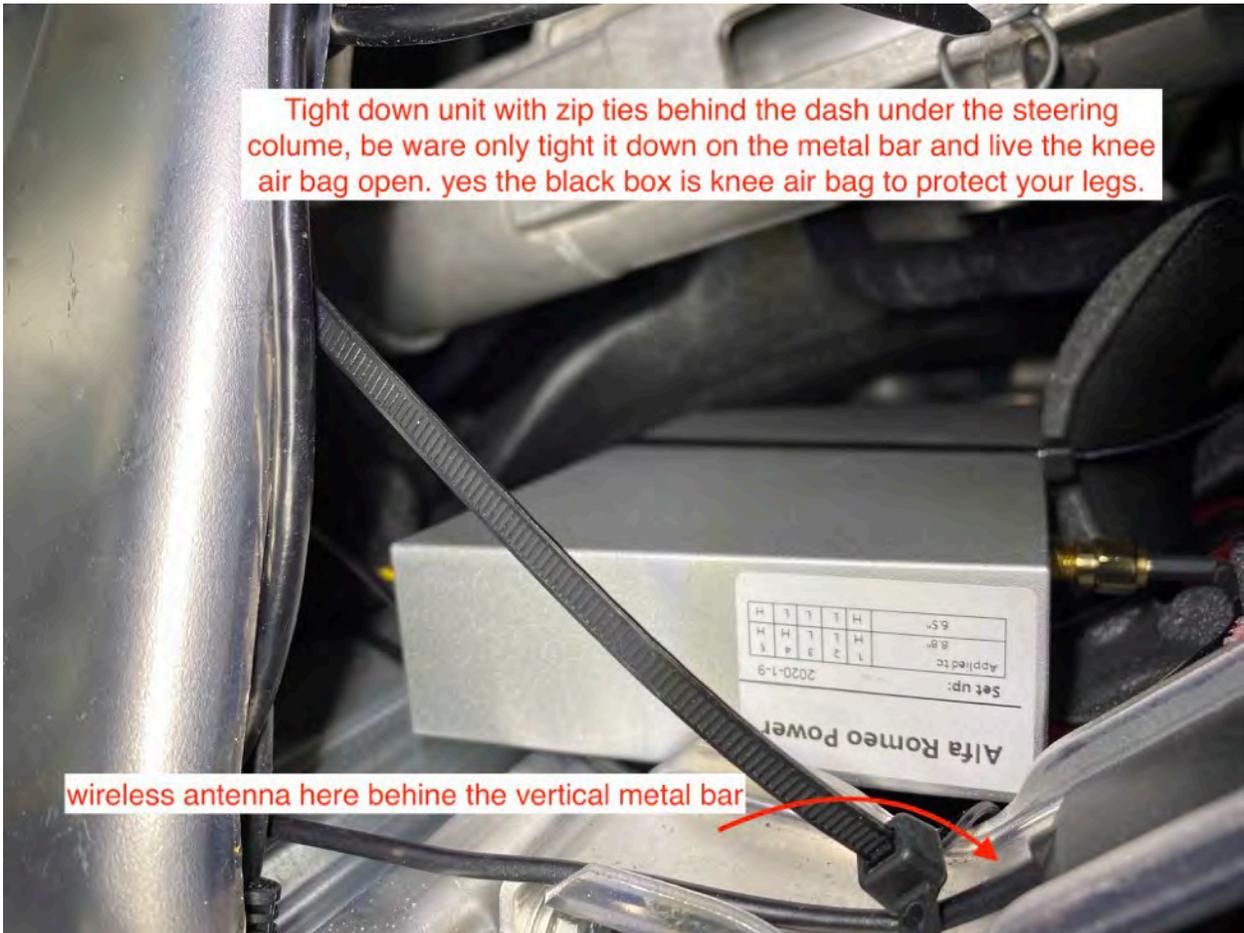

opinion #2 , easy mode,
You can clip mic here and
save some time running the wire

Tight down unit with zip ties behind the dash under the steering colume, be ware only tight it down on the metal bar and live the knee air bag open. yes the black box is knee air bag to protect your legs.

wireless antenna here behind the vertical metal bar

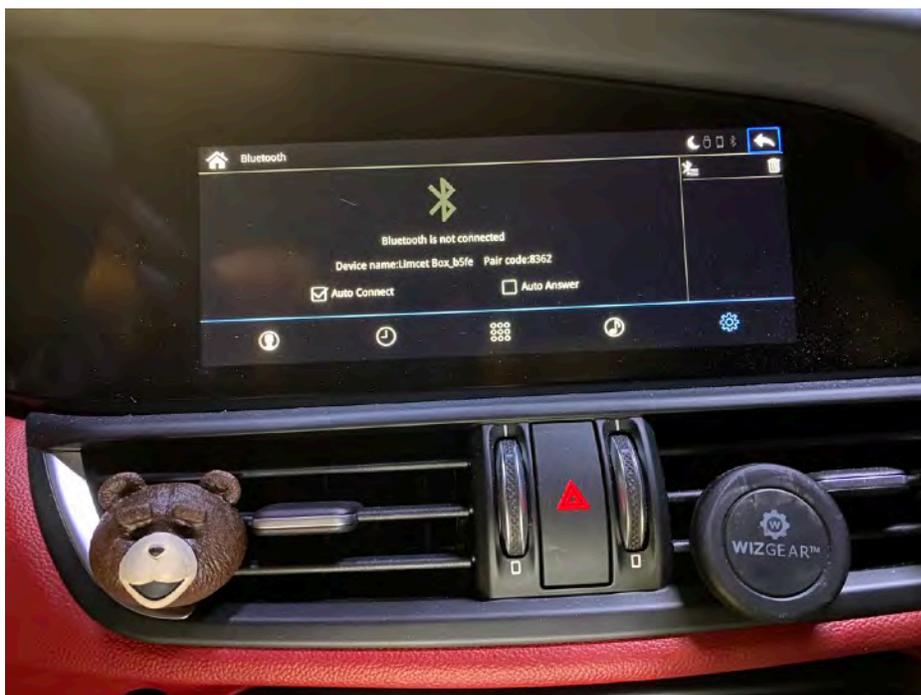

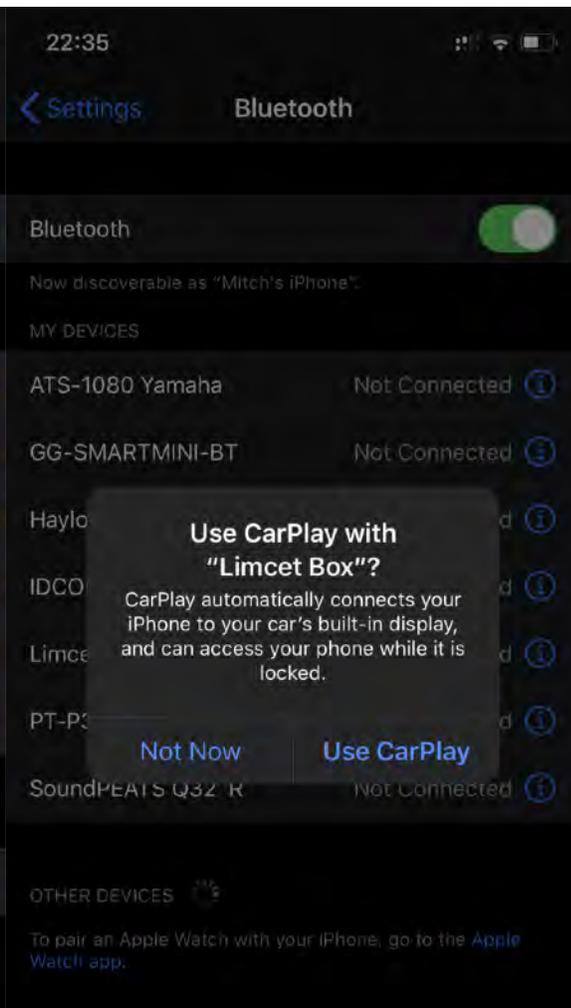

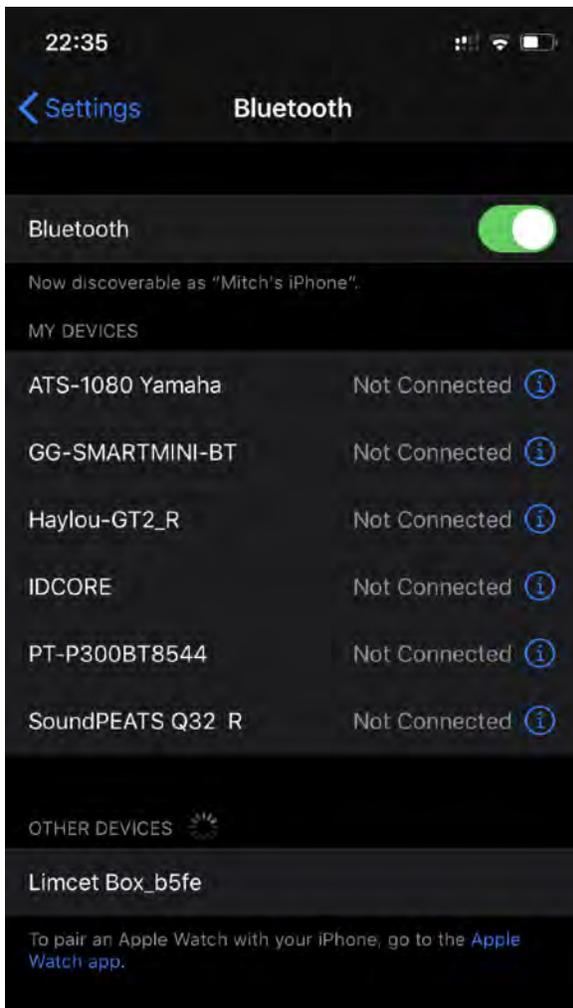

Setup Process

After start the car, long press menu bottom and you will get this screen

Select bluetooth, pair your phone

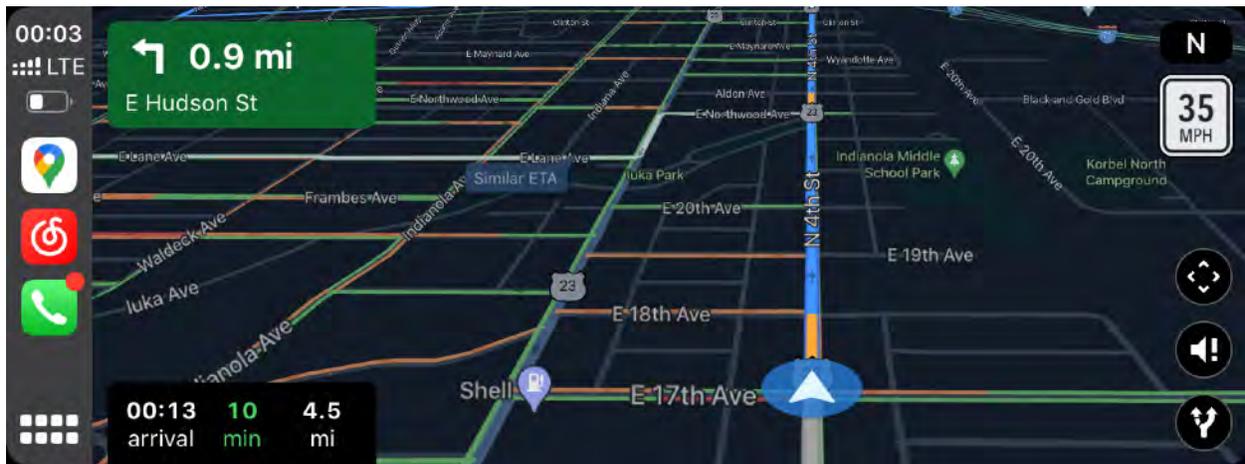

In case there is no sound, press menu bottom and jump back to factory screen,

Select AUX input in media setting and take it in AUX at all time when you using CarPlay.

Enjoy! now you have your wireless CarPlay experience in your 2017 Alfa.

FYI, the very first time you get wireless connection, the response will be a bit slow as data transfer take some bandwidth.

simply turn off the car and lock it for 5 mins. Next time when you step in the car, wireless connection will establish itself, the operation will be very smooth with no delay.
